

PRIMITIVE BREATH: Subjective Interpretation through Observation of Lifelikeness Phenomena in a WebAL Environment

Sakae Kudo, Independent Developer, JAPAN, sakae.alife.project@gmail.com

"Does 'life-likeness' reside within mathematically optimized code, or does it emerge within the non-interventional time spent simply observing an autonomous system?"

PARADIGM SHIFT: FROM OPTIMIZATION TO OBSERVATION

1. Critique of Conventional ALife

- **Beyond Mathematical Optimization:** Conventional ALife studies often emphasize complex parameter analysis and statistical optimization. However, the essential "life-likeness" eludes mathematical description.
- **The Power of Observation:** True life-likeness emerges within the non-interventional time spent simply observing an autonomously moving system.

2. A New Direction in WebAL (Personal Immersion via PWA)

- While adhering to the WebAL convention (Taylor et al., 2016), PRIMITIVE BREATH interprets technological accessibility in a fundamentally different direction: accessible on desktop and mobile as a PWA, it deliberately eliminates social sharing and network features to provide a highly personal observation environment, as detailed in Table 1 below.

Evaluation Axis	Conventional WebAL	PRIMITIVE BREATH
Purpose of Accessibility	Public Sharing	Personal Immersion
Environment	Desktop / Web	Desktop / PWA
User Activity	Interventional operation	Non-intervention observation

AI CO-CREATION: SYSTEM DEVELOPMENT BY A NON-ENGINEER

1. Two-Layer AI Co-creation Scheme and Custom Ecosystem Algorithms (Ecosystem Design)

- **Role Division:** Constructed approximately 2,600 lines of original algorithms without directly writing code, utilizing a two-layer AI framework: a conversational AI (**Architect**) for conceptual design and a task-oriented AI (**Builder**) for source code generation.
- **Iterative Evaluation:** Refined through iterative dialogue, aligning the non-engineer developer's subjective evaluation of life-likeness with AI's technical feasibility within a Single HTML constraint.
- **Asymmetric Strategies:** Amber exhibits active predation, rapid metabolism, and high turnover, while Green forms swarms and maintains energy through resonance.
- **Non-Boids Swarming:** Green's behavior is realized through a custom algorithm derived directly from unique metabolic logic rather than the standard Boids model.

THE MECHANISM OF PERCEPTION: TEMPORAL NEUTRALIZATION

1. The Metronome Ability: Neutralization of Perception

- **Two Overlapping Time Axes:** Integrates a fixed 60 BPM metronome (**Absolute Time**) alongside changing metabolic dynamics (**Relative Time**).
- **Unconscious Immersion:** The overlap and neutralization of these distinct sensory rhythms bring the observer into a deep flow

2. Retrospective Resonance and the Contours of Life.

- **Contemporary Realization of Braitenberg:** A modern realization of Braitenberg's synthetic approach—deriving a "life-likeness" from minimal survival and metabolic rules.
- **Bodily Perception & Continuity:** The sensory neutralization resonates with Merleau-Ponty's notion of bodily perception.

OBSERVER AS THE MEANING MAKER: REEVALUATING OBSERVATION

1. The Recognition of Life-likeness and Deepening Gaze

- **Scale Dependency:** Whether a subject is recognized as "life" or merely a "phenomenon" **may depend on** the observer's framework of recognition (e.g., a single locust vs. massive swarm covering the sky ; yeast fermentation appears as a mere chemical reaction vs. microscope into recognized "life"). Life-likeness actualizes only when calibrated to human perception.
- **Immersive Loop:** Coupled with the accumulation of history in the **ARCHIVE STRATA** and daily re-visitations via PWA, simple viewing deepens into continuous, immersive observation.

2. Conclusion: Observer as the Meaning Maker

- **Role of Humans in the Post-AI Era:** PRIMITIVE BREATH suggests while AI can generate sophisticated systems, the ultimate privilege remaining for humans is to become the primary subjects (Observers) who bestow **narrative** and **meaning** upon mere computational events (the rise and fall of Amber and Green).
- **Experimental Philosophy and The Final Breath:** PRIMITIVE BREATH is a self-contained digital experiment. The system does not complete within its code; it begins to etch its history as a living entity only when the observer perceives a distinct "breath" within the petri dish.

“Code available”
